GRAMSYNC | RURAL PRODUCTION ORCHESTRATION NETWORK

PROBLEM

What problem are we addressing?

- Small and marginal farmers often have fragmented, time-sensitive harvests but limited visibility into demand, transport, storage and alternative markets.
- A higher market price does not always mean higher farmer income. Transport costs, handling, storage, delays and spoilage can significantly change the actual value realized at the farm gate.
- The real gap is coordination: connecting what farmers have with where demand exists, when it is needed, and how it can feasibly reach the right destination.
- Why is this difficult?
- Supply is fragmented, while buyers, markets, transporters, storage and processing capacity are distributed across different actors, locations and constraints.
- Farmers therefore lack a unified way to evaluate where, when and how their produce should move.

Key Resources

What resources does GRAMSYNC require?

- Farmer & FPO Network: Harvest, supply and aggregation information
- Market & Demand Data: Prices, buyers, quality and timing requirements
- Logistics & Storage Network: Capacity, location, availability and costs
- Rural Enterprise Network: Processing, SHG and value-addition capacity
- Technology & AI: Data platform, optimization and decision-support
- Trust & Field Network: FPOs, cooperatives and local partners for adoption
- Core Resource: A connected view of supply, demand, capacity and constraints.

SOLUTION

How can GRAMSYNC address this gap?

- **GRAMSYNC** is an AI-powered rural production orchestration platform that helps farmers and FPOs coordinate the movement of agricultural produce by connecting farm-level supply with demand, transportation, storage and processing capacity.
- Instead of simply showing farmers the highest market price, GRAMSYNC evaluates the feasibility and potential net realization of different pathways by considering factors such as quantity, quality, distance, transportation cost, storage availability, time sensitivity and expected losses.

The platform can:

- • Aggregate fragmented supply from farmers through FPOs and cooperatives to identify viable collective quantities.
- • Match supply with relevant demand from mandis, wholesalers, processors, retailers and institutional buyers based on quantity, quality, timing and requirements.
- • Coordinate transportation by identifying suitable movement options and opportunities to consolidate multiple farmer lots.
- • Plan storage decisions by considering available capacity, expected shelf life, timing and alternative market opportunities.
- • Compare feasible pathways such as immediate sale, aggregation, storage, processing or movement to an alternative destination.
- • Estimate net realization rather than focusing only on the headline selling price, helping farmers understand the economic trade-offs of different options.
- • Connect rural productive capacity such as SHGs, processing units and other enterprises wherever value addition can create a feasible pathway for the produce.
- The goal is not to create another marketplace. GRAMSYNC acts as a coordination and decision-support layer that helps align fragmented supply with the right buyer, destination, transport, storage and timing.

Value Propositions

VALUE PROPOSITIONS

- What value does GRAMSYNC deliver?
- GRAMSYNC helps farmers make better selling and movement decisions by connecting supply, demand, transport and storage in one coordinated layer.
- For farmers, it compares feasible options based on price, quantity, distance, transport cost, storage, timing and potential spoilage, helping them understand the likely net realization from different pathways.
- For FPOs and cooperatives, GRAMSYNC helps aggregate farmer supply and connect suitable quantities with relevant buyers, processors and markets.
- For buyers, transporters and storage operators, it provides better visibility of available supply, demand and capacity, helping coordinate movement and fulfilment.
- Core Value:
- Better visibility of supply and demand
- Better comparison of selling pathways
- Improved coordination between rural stakeholders
- Smarter aggregation and movement
- Greater transparency in decision-making
- Better consideration of time, cost and spoilage
- Central Value Proposition:
- GRAMSYNC helps answer: “Where, when and how should this harvest move?” rather than simply “Where is the price highest?”

Customer Relationship

What relationship will GRAMSYNC build with farmers?

- GRAMSYNC will build a trust-based, farmer-first relationship where farmers remain in control of their selling decisions.
- Simple guidance: Present options in an easy-to-understand manner.
- Local-language support: Enable regional-language and voice-based interaction.
- Transparent recommendations: Clearly show the factors behind each suggested pathway.
- Assisted access: FPOs, cooperatives and local coordinators can help farmers use the platform.
- Continuous support: Farmers can receive updated information as prices, demand, transport and storage availability change.
- Farmer remains the decision-maker: GRAMSYNC provides information and comparisons, but the final decision always remains with the farmer.
- Core Relationship
- Build trust through transparency, simplicity and useful decisions, not by making opaque recommendations.

Channels

How will GRAMSYNC reach its users?

GRAMSYNC uses a hybrid assisted-digital model, reaching farmers through trusted rural networks while connecting them digitally to the wider market ecosystem.

- FPOs & Cooperatives: Farmer onboarding, aggregation and assisted access
- Village / Community Partners: Support for farmers with limited digital access
- Mobile + Voice Interface: Simple local-language access to GRAMSYNC
- Buyers & Processors: Direct demand and procurement connections
- Transport & Storage Partners: Coordination of movement and available capacity
- Existing Market Networks: Connect with mandis and other established market channels

How do the channels work together?
FPO / Community → Farmer → GRAMSYNC → Buyer / Market / Processor with transport and storage connected around the movement of produce.
Core Channel Principle
“Meet farmers where they already operate, then bring coordination to them.”

Customer Segments

For whom are we creating value?

- Our primary customer and beneficiary is:
- Small and marginal farmers, especially those producing perishable crops and facing challenges in finding the right market, transport and timing.
- Our key supporting customer segments are:
- FPOs & Cooperatives: Aggregate farmer produce and coordinate collective supply.
- Buyers & Processors: Source suitable quantities of agricultural produce.
- Transporters: Provide movement capacity for aggregated supply.
- Storage Operators: Provide storage when immediate sale is not the most feasible option.
- SHGs & Rural Enterprises: Support processing, preservation and value addition where relevant.
- Our ecosystem
- Farmers → FPOs / Cooperatives → GRAMSYNC → Buyers / Markets / Processors
- with transport, storage and rural enterprises supporting the flow.
- Core focus
- The farmer remains the primary beneficiary, while GRAMSYNC creates value by coordinating the wider rural ecosystem around the farmer's actual harvest.

Cost Structure

What does it cost the farmer?

- GRAMSYNC follows a farmer-first, low-cost model. Essential decision-support remains free or highly affordable, so farmers are not charged simply for accessing information or comparing options.
- What do farmers get?
- Market & demand information with feasible selling-pathway comparison
- Net-realization estimates considering costs, timing and constraints
- FPO aggregation with relevant transport & storage options
- Local-language / assisted access with transparent costs
- Where does GRAMSYNC incur costs?
- Platform, AI & data infrastructure, including market/logistics integration
- Farmer/FPO onboarding, verification & coordination
- Buyer, transport & storage partnerships
- FARMER-FIRST PRINCIPLE
- Farmers should not pay simply to know where, when and how their produce can move.
- GRAMSYNC can sustain this model through B2B subscriptions, coordination services and enterprise tools, keeping essential farmer access free or affordable

Revenue Stream

How does GRAMSYNC generate revenue?

- GRAMSYNC follows a B2B2F model: essential farmer access remains free or affordable, while organizations benefiting from better sourcing and coordination pay for the platform.
- • B2B Subscriptions: Buyers, processors & procurement networks pay for supply visibility and planning.
- • Coordination Fees: Small fees for successfully coordinated procurement, aggregation & logistics workflows.
- • FPO / Enterprise Tools: Paid dashboards for aggregation, demand planning and fulfilment.
- • Logistics & Storage Services: Revenue from qualified bookings and coordination for partner infrastructure.
- Revenue Principle
- “Keep the farmer free. Monetize the coordination value created for the ecosystem.”
- This creates a sustainable business while directing the economic benefit of better coordination back toward rural producers and enterprises.
